Content

The base of the POI report is to find a vehicle in the selected radius by an address.

On the basis of the visits found at the location you are looking for, the report provides a list of the vehicles with driver (if driver authorization is available), driving, leaving, stay and possibly the active secondary drives during the stay.

The report continues to provide information on the total duration of the stay and the number of stays of all vehicles at the chosen position.

For every stay, a map is offered showing the route of the vehicle at the time.

From the HTML output, you can change the time period and the output format using the "switch" button in the upper right area of the output for the current settings of the report template.

In addition, a chart is displayed above the table, which makes the visits more visually on a scale over the stays (eg last calendar month).

Output

This report supports the following output formats:

- HTML
- PDF
- Excel
- CSV
